Table of Contents

This user guide supports the evaluation kit for the FL7733A. It should be used in conjunction with the FL7733A datasheet as well as Fairchild's application notes and technical support team. Please visit Fairchild's website at www.fairchildsemi.com.

1. Introduction

This document describes a solution for an universal AC input voltage LED driver using the FL7733A Primary-Side Regulation (PSR) single-stage controller. The input voltage range is 90 V_{RMS} ~ 277 V_{RMS} and there is one DC output with a constant current of 1.0 A at 50 V. This document contains a general description of the FL7733A, the power supply solution specification, schematic, bill of materials, and typical operating characteristics.

1.1. General Description of FL7733A

The FL7733A is an active Power Factor Correction (PFC) controller for use in single-stage flyback topology or buck-boost topology. Primary-side regulation and single-stage topology minimize cost by reducing external components such as the input bulk capacitor and secondary side feedback circuitry. To improve power factor and Total Harmonic Distortion (THD), constant on-time control is utilized with an internal error amplifier and a low bandwidth compensator. Precise constant-current control provides accurate output current, independent of input voltage and output voltage. Operating frequency is proportionally changed by the output voltage to guarantee Discontinuous Current Mode (DCM) operation, resulting in high efficiency and simple designs. The FL7733A also provides open-LED, short-LED, and over-temperature protection functions.

1.2. Controller Features

High Performance

- Cost Effective Solution without requiring the use of an Input Bulk Capacitor and Secondary-Side Feedback Circuitry
- Power Factor Correction
- THD <10% over Universal Line Range
- CC Tolerance:
  - < ±1% by Universal Line Voltage Variation
  - < ±1% by 50% ~ 100% Load Voltage Variation
  - < ±1% by ±20% Magnetizing Inductance Variation
- High-Voltage Startup with V_{DD} Regulation
- Adaptive Feedback Loop Control for Startup without Overshoot

High Reliability

- LED Short / Open Protection
- Output Diode Short Protection
- Sensing Resistor Short / Open Protection
- V_{DD} Over-Voltage Protection (OVP)
- V_{DD} Under-Voltage Lockout (UVLO)
- Over-Temperature Protection (OTP)
- All Protections by Auto Restart
- Cycle-by-Cycle Current Limit
- Application Voltage Range: 80 V_{AC} ~ 308 V_{AC}

2. Evaluation Board Specifications

Table 1. Specifications for LED Lighting Load

Description		Symbol	Value	Comments
Input	**Voltage**	$V_{IN.MIN}$	90 V_{AC}	Minimum AC Input Voltage
		$V_{IN.MAX}$	277 V_{AC}	Maximum AC Input Voltage
		$V_{IN.NOMINAL}$	120 V / 230 V	Nominal AC Input Voltage
	Frequency	f_{IN}	60 Hz / 50 Hz	Line Frequency
Output	**Voltage**	$V_{OUT.MIN}$	7 V	Minimum Output Voltage
		$V_{OUT.MAX}$	55 V	Maximum Output Voltage
		$V_{OUT.NOMINAL}$	50 V	Nominal Output Voltage
	Current	$I_{OUT.NOMINAL}$	1.0 A	Nominal Output Current
		CC Deviation	< ±0.85%	Line Input Voltage Change: 90~277 V_{AC}
			< ±1.75%	Output Voltage Change: 7~55 V
Efficiency		Eff_{90VAC}	87.56%	Efficiency at 90 V_{AC} Input Voltage
		Eff_{120VAC}	88.96%	Efficiency at 120 V_{AC} Input Voltage
		Eff_{140VAC}	89.49%	Efficiency at 140 V_{AC} Input Voltage
		Eff_{180VAC}	90.13%	Efficiency at 180 V_{AC} Input Voltage
		Eff_{230VAC}	90.31%	Efficiency at 230 V_{AC} Input Voltage
		Eff_{277VAC}	90.26%	Efficiency at 277 V_{AC} Input Voltage
PF / THD		PF /THD_{90VAC}	0.997 / 3.36%	PF/THD at 90 V_{AC} Input Voltage
		PF / THD_{120VAC}	0.992 / 3.55%	PF/THD at 120 V_{AC} Input Voltage
		PF / THD_{140VAC}	0.987 / 3.60%	PF/THD at 140 V_{AC} Input Voltage
		PF / THD_{180VAC}	0.975 / 4.44%	PF/THD at 180 V_{AC} Input Voltage
		PF / THD_{230VAC}	0.944 / 5.36%	PF/THD at 230 V_{AC} Input Voltage
		PF / THD_{277VAC}	0.902 / 6.88%	PF/THD at 277 V_{AC} Input Voltage
Temperature	**FL7733A**	$T_{FL7733A}$	57.9ºC	Open-Frame Condition (T_A = 25ºC) FL7733A Temperature
	Primary MOSFET	T_{MOSFET}	66.1ºC	Primary MOSFET Temperature
	Secondary Diode	T_{DIODE}	65.2ºC	Secondary Diode Temperature
	Bridge Diode	$T_{BRG-DIODE}$	60.1ºC	Bridge Diode Temperature

All data of the evaluation board measured with the board was enclosed in a case and external temperature around T_A=25°C.

8.3. Constant-Current Regulation

The output current deviation for wide output voltage ranges from 7 V to 55 V is less than ±1.75 % at each line voltage. Line regulation at the output voltage (52 V) is also less than ±0.85%. The results were measured with E-load [CR Mode].

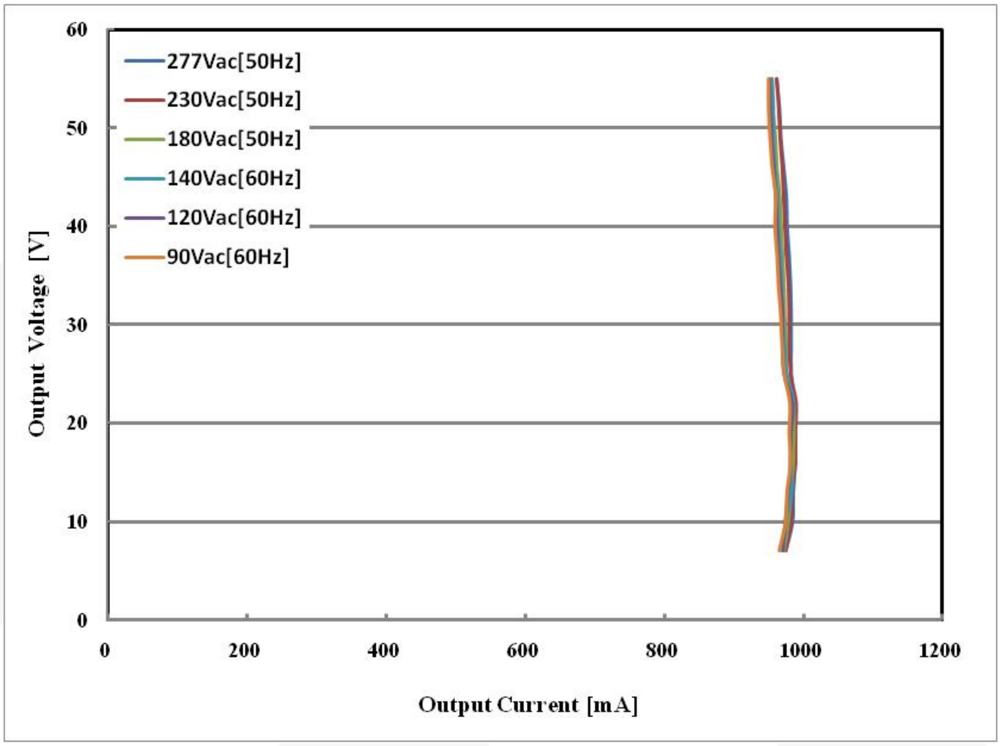

Figure 20. Constant-Current Regulation

Table 5. Constant-Current Regulation by Output Voltage Change (7 ~ 55 V)

Input Voltage	Min. Current [mA]	Max. Current [mA]	Tolerance
90 V_{AC} [60 Hz]	950	981	±1.61%
120 V_{AC} [60 Hz]	951	984	±1.71%
140 V_{AC} [60 Hz]	955	986	±1.60%

V_S Circuits for Wide Output

The first consideration for R1, R2, and R3 selection is to set V_S to 2.45 V to ensure high-frequency operation at the rated output power.

The second consideration is V_S blanking. The output voltage is detected by auxiliary winding and a resistive divider connected to the VS pin, as shown in Figure 21. However, in a single-stage flyback converter without a DC link capacitor, auxiliary winding voltage cannot be clamped to reflected output voltage at low line voltage due to the small Lm current, which induces V_S voltage-sensing error. Frequency decreases rapidly at the zero-crossing point of line voltage, which can cause LED light flicker. To maintain constant frequency over the whole sinusoidal line voltage, V_S blanking disables V_S sampling at less than a particular line voltage $V_{IN.bnk}$ by sensing the auxiliary winding.

The third consideration is V_S level, which should be operated between 0.6 V and 3 V to avoid triggering SLP and V_S OVP in wide output application. V_S level can be maintained using additional V_S circuits, as shown in Figure 21.

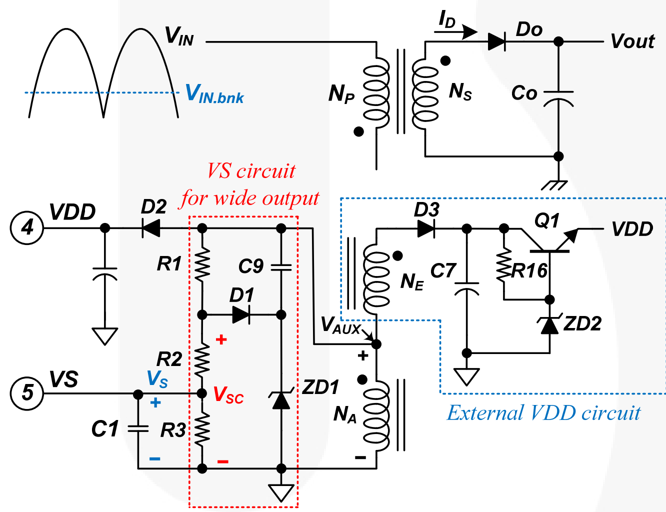

Figure 21. External Circuitry for System Operation in Wide Output Votage Ranges

Considering the maximum switching frequency up to 50% of maximum output voltage, Zener diode and R1, R2, and R3 are obtained as:

$$V_{ZD1} < (V_{DD.OVP} \times 0.5) - V_{F.D1} \tag{1}$$

where $V_{F.D1}$ is the forward voltage of D1 connected in series with Zener diode ZD1.

Considering Zener diode voltage regulation and its power rating, R1 can be selected to limit the Zener diode current I_{ZD1} to 10 mA maximum, such as:

$$R1 = \frac{(V_{DD-OVP} - V_{SC})}{10mA} = 1.2\ k\Omega \tag{2}$$

where V_{SC} is voltage clamped by D1 and ZD1.

$$R2 = n_{AP} \times \frac{V_{IN.bnk}}{I_{VS.bnk}} - R1 \tag{3}$$

where $V_{IN.bnk}$ and $I_{VS.bnk}$ line voltage level and V_S current for V_S blanking, respectively.

$$R3 \geq \frac{R2 \times 2.45}{V_{SC} - 2.45} \tag{4}$$

Additional consideration in V_S circuits for wide output voltage range is t_{DIS} delay, which is caused by the voltage difference when the V_{AUX} across auxiliary winding is clamped to V_{SC}, as shown in Figure 22. This delay lasts until V_{AUX} is at the same level as V_{SC} and may affect constant output current regulation. It can be removed by capacitor C9 connected between auxiliary winding and cathode terminal of Zener diode ZD1. The V_{AUX} is divided into capacitor voltage V_{C3} and V_{ZD1} after the MOSFET gate is turned off. Then V_{C3} maintains its voltage without discharging while V_{ZD2} slowly decreases to V_{AUX} – V_{C3} as the output diode current I_D reaches zero. Therefore, V_S can follow V_{AUX}, as shown by the dotted line in Figure 22. C3 should be selected to the proper value depending on resonant frequency determined by the resonance between magnetizing inductance Lm and MOSFET's C_{OSS}. The 330 pF used in this application was selected by trial and error. Its value can be obtained as:

$$C9 = \frac{300\ kHz}{f_r} \cdot 330\ pF \tag{5}$$

where f_r is the resonance frequency determined by the resonance between C_{OSS} and L_m.

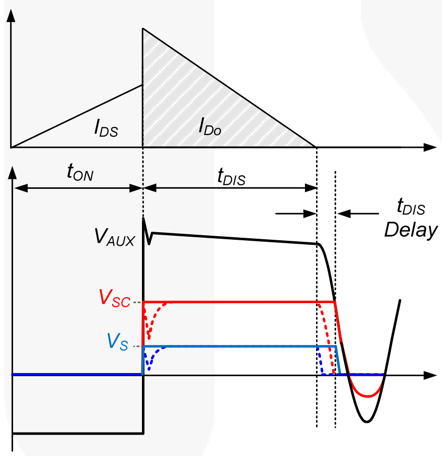

Figure 22. Waveforms in V_S Circuits

V_{DD} Circuit for Wide Output

FL7733A's V_{DD} operation range is 8.75 ~ 23 V and UVLO is triggered and shuts down switching if output voltage is lower than V_{OUT}-V_{UVLO} (8.75×N_S /N_A). Therefore, V_{DD} should be supplied properly without triggering UVLO across the wide output voltage range of 7 ~ 55 V. V_{DD} can be supplied by adding external winding N_E and V_{DD} circuits composed of voltage regulator, as shown in Figure 21. The N_E should be designed so V_{DD} can be supplied without triggering UVLO at minimum output voltage ($V_{min.OUT}$). Therefore, the external winding NE can be determined as follows:

$$N_E > \frac{(8.75 + V_{CE.Q1} + V_{F.D3})}{(V_{F.Do} + V_{min.OUT})} \times N_S - N_A \tag{6}$$

where $V_{CE.Q1}$ is Q1's collector-emitter saturation voltage, $V_{F.D3}$ is D3's forward voltage, and $V_{F.Do}$ is forward voltage of the output diode at minimum output voltage.

8.4. Short- / Open-LED Protections

Figure 23 to Figure 26 show the operating waveforms when the LED short protection is triggered and recovered. Once the LED short occurs, SCP is triggered and V_{DD} starts “Hiccup” Mode with JFET regulation times [250 ms]. This lasts until the fault condition is removed. Systems can restart automatically when the output load returns to normal condition. CH1: V_{DD} (10 V / div), CH2: V_{IN} (200 V / div), CH3: V_{GATE} (10 V / div), I_{OUT} (500 mA / div), Time Scale: (500 ms / div).

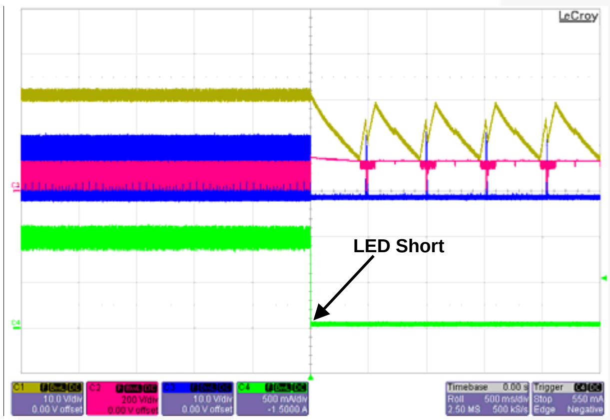

Figure 23. V_{IN} = 90 V_{AC} / 60 Hz, [LED Short]

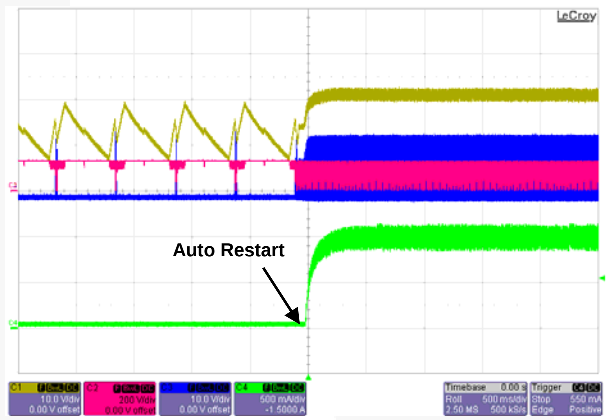

Figure 24. V_{IN} = 120 V_{AC} / 60 Hz, [LED Restore]

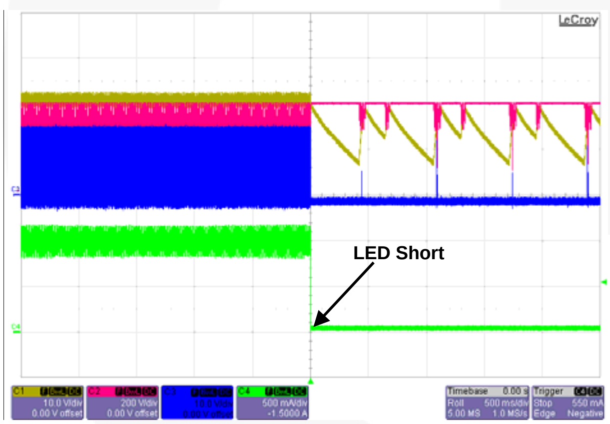

Figure 25. V_{IN} = 277 V_{AC} / 50 Hz, [LED Short]

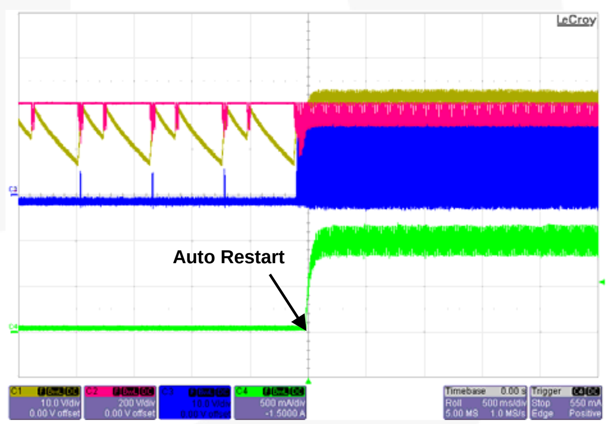

Figure 26. V_{IN} = 277 V_{AC} / 50 Hz, [LED Restore]

Figure 27 to Figure 30 show the operating waveforms when the LED open condition is triggered and recovered. Once the output goes open circuit, V_S OVP or V_{DD} OVP are triggered and V_{DD} starts Hiccup Mode with JFET regulation times [250 ms]. This lasts until the fault condition is eliminated. Systems can restart automatically when returned to normal condition. CH1: V_{DD} (10 V / div), CH2: V_{IN} (200 V / div), CH3: V_{GATE} (10 V / div), V_{OUT} (50 V / div), Time Scale: (500 ms / div).

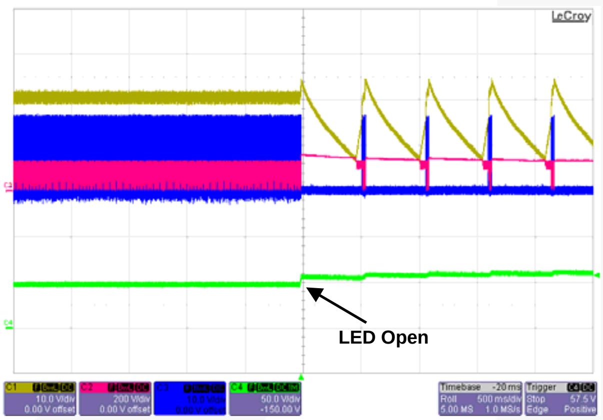

Figure 27. V_{IN} = 90 V_{AC} / 60 Hz, [LED Short]

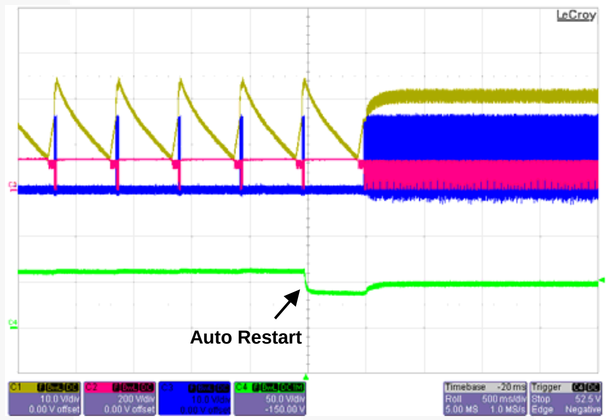

Figure 28. V_{IN} = 90 V_{AC} / 60 Hz, [LED Restore]

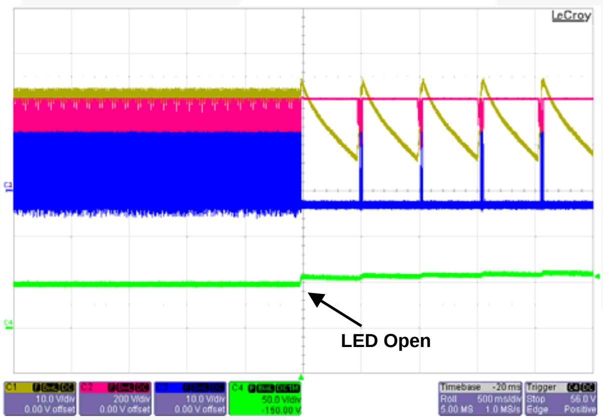

Figure 29. V_{IN} = 277 V_{AC} / 50 Hz, [LED Short]

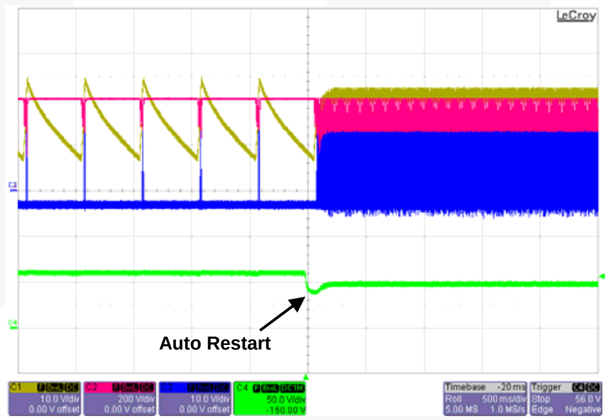

Figure 30. V_{IN} = 277 V_{AC} / 50 Hz, [LED Restore]

Note:

1. When the LED load is re-connected after open-LED condition, the output capacitor is quickly discharged through the LED load and the inrush current by the discharge could destroy the LED load.

8.5. Efficiency

System efficiency is 87.56% ~ 90.81% over input voltages 90 ~ 277 V_{AC}. The results were measured using actual rated LED loads 30 minutes after startup.

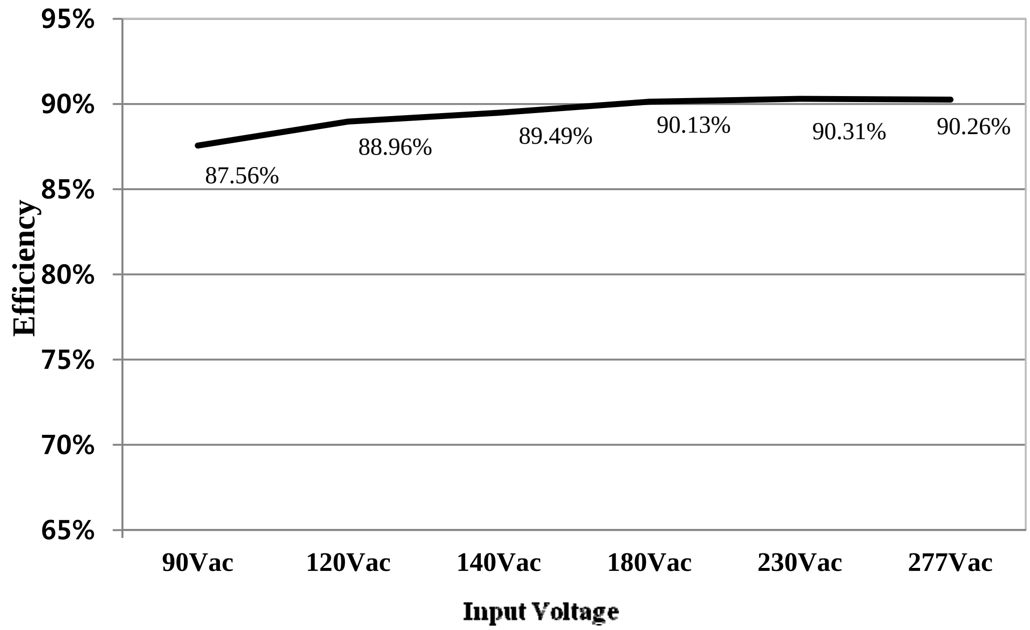

Figure 31. System Efficiency

Table 7. System Efficiency

Input Voltage	Input Power (W)	Output Current (A)	Output Voltage (V)	Output Power (W)	Efficiency (%)
90 V_{AC} [60 Hz]	53.68	0.952	49.40	47.00	87.56
120 V_{AC} [60 Hz]	53.18	0.955	49.52	47.31	88.96
140 V_{AC} [60 Hz]	53.05	0.958	49.57	47.47	89.49
180 V_{AC} [50 Hz]	54.43	0.963	50.95	49.06	90.13
230 V_{AC} [50 Hz]	54.66	0.969	50.94	49.36	90.31
277 V_{AC} [50 Hz]	54.78	0.974	50.78	49.44	90.26

8.6. Power Factor (PF) & Total Harmonic Distortion (THD)

The FL7733A evaluation board shows excellent THD performance: much less than 10%. The results were measured using actual rated LED loads 10 minutes after startup.

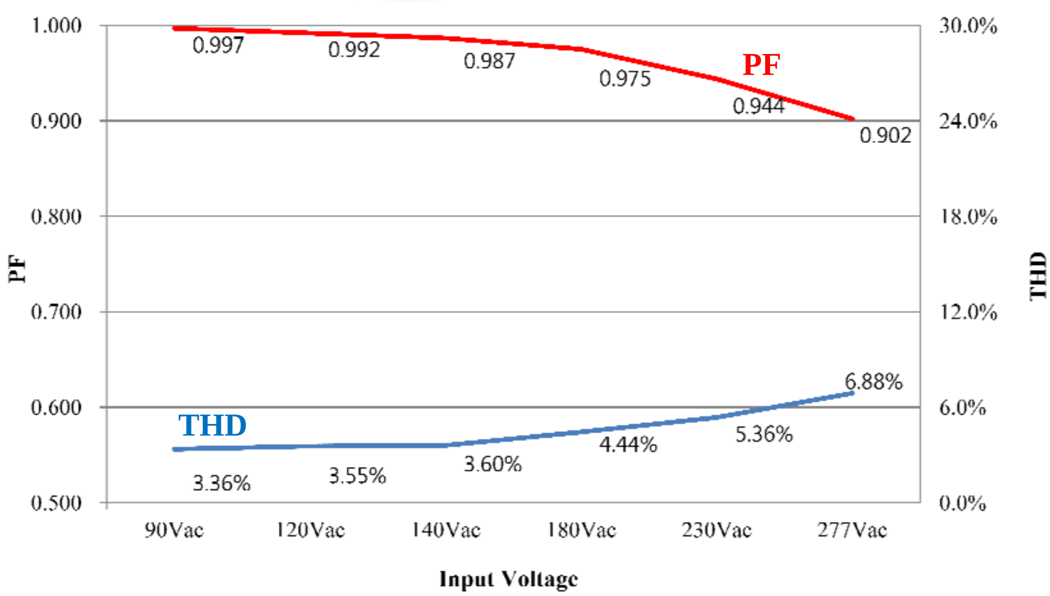

Figure 32. Power Factor & Total Harmonic Distortion

Table 8. Power Factor & Total Harmonic Distortion

Input Voltage	Output Current (A)	Output Voltage (V)	Power Factor	THD (%)
90 V_{AC} [60 Hz]	0.952	49.40	0.997	3.36
120 V_{AC} [60 Hz]	0.955	49.52	0.992	3.55
140 V_{AC} [60 Hz]	0.958	49.57	0.987	3.60
180 V_{AC} [50 Hz]	0.963	50.95	0.975	4.44
230 V_{AC} [50 Hz]	0.969	50.94	0.944	5.36
277 V_{AC} [50 Hz]	0.974	50.78	0.902	6.88

8.7. Harmonics

Figure 33 to Figure 36 show current harmonics measured using actual rated LED loads.

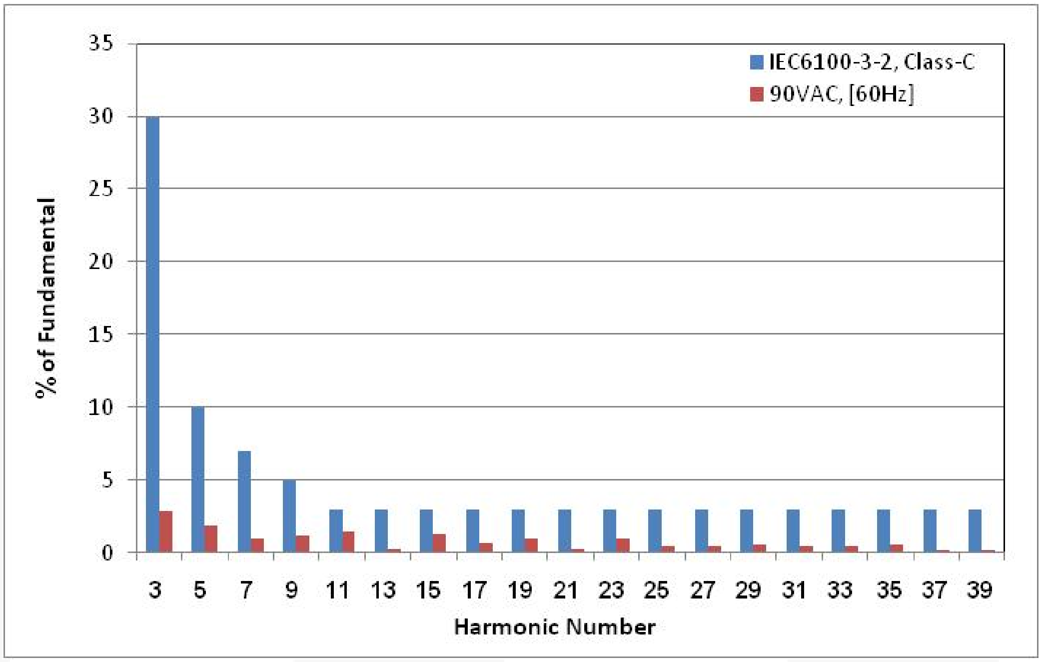

Figure 33. V_{IN} = 90 V_{AC} / 60 Hz

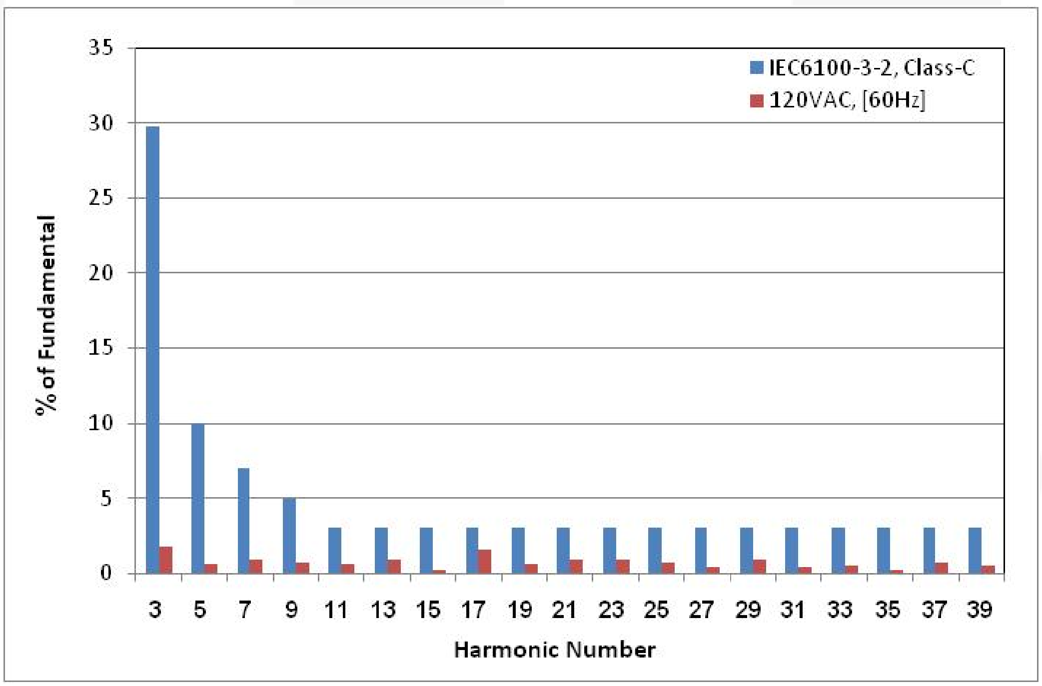

Figure 34. V_{IN} = 120 V_{AC} / 60 Hz

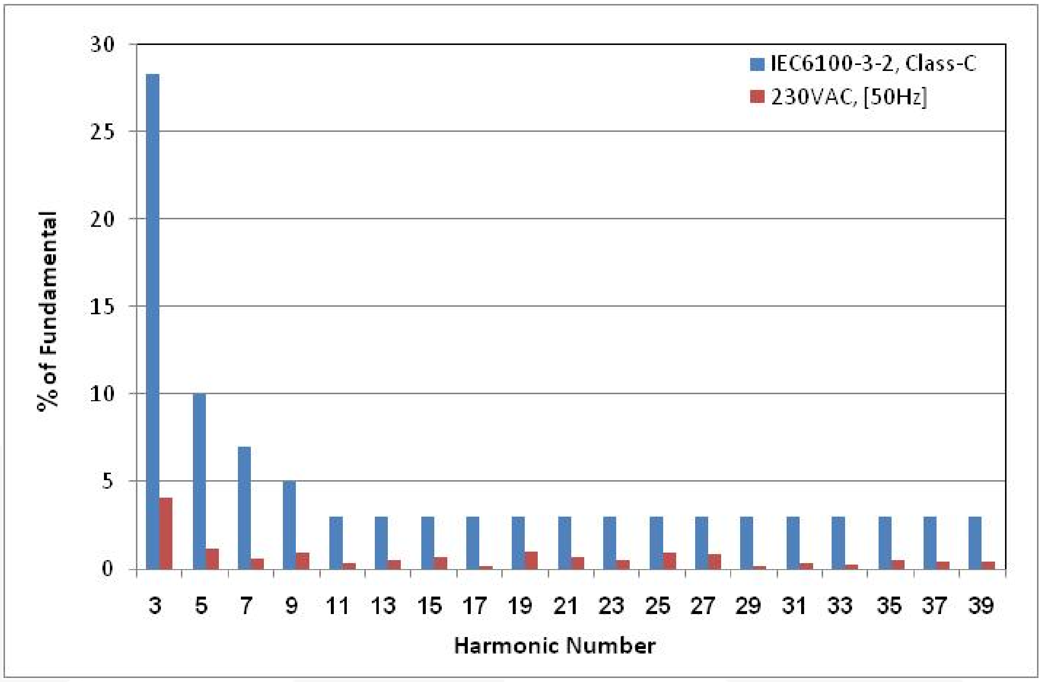

Figure 35. V_{IN} = 230 V_{AC} / 50 Hz

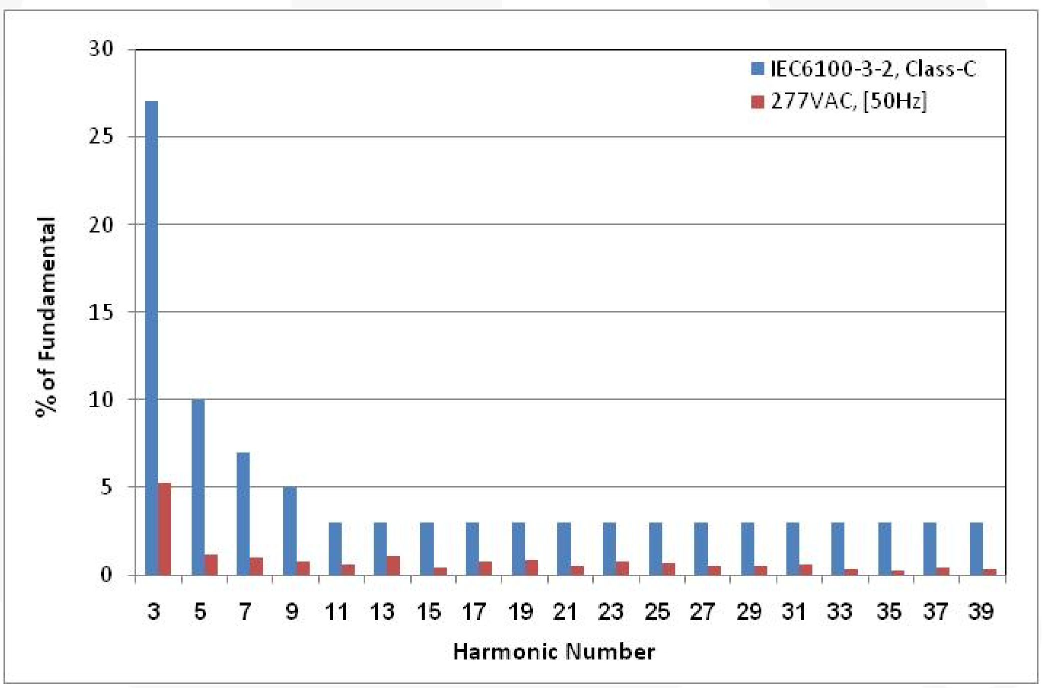

Figure 36. V_{IN} = 277 V_{AC} / 50 Hz

8.8. Operating Temperature

Temperatures on all components for this board are less than 68ºC.

The results were measured using actual rated LED loads 60 minutes after startup.

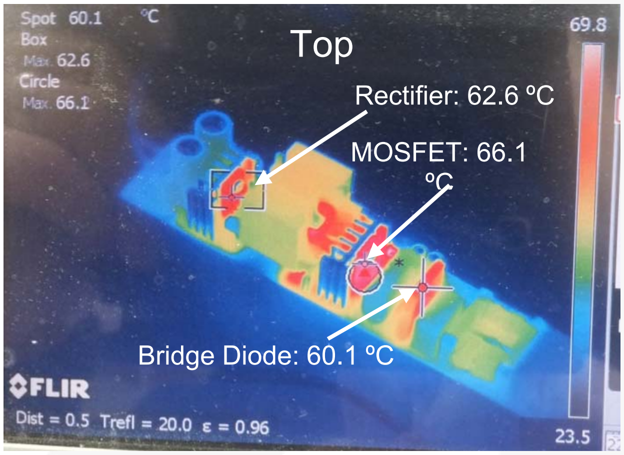

Figure 37. V_{IN} = 90 V_{AC} / 60 Hz

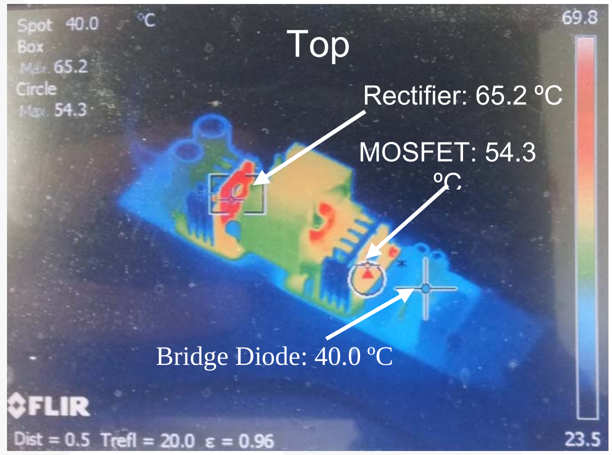

Figure 38. V_{IN} = 277 V_{AC} / 50 Hz

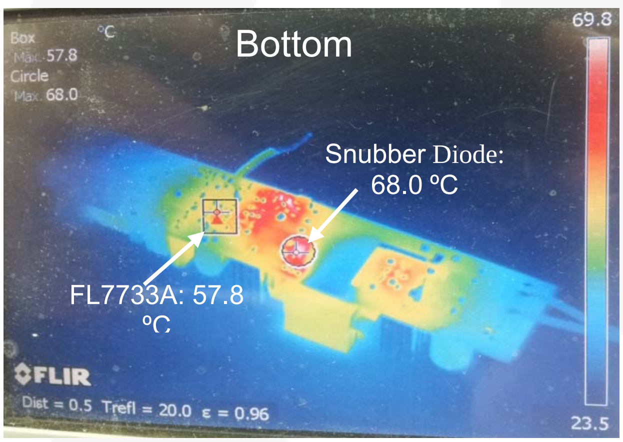

Figure 39. V_{IN} = 90 V_{AC} / 60 Hz

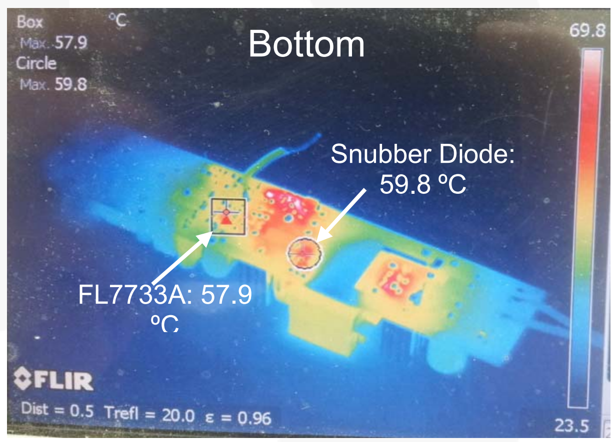

Figure 40. V_{IN} = 277 V_{AC} / 50 Hz

Note:

2. The IC temperature can be improved by the PCB layout.

8.9. Electromagnetic Interference (EMI)

All measurements were conducted in observance of EN55022 criteria.

The results were measured using actual rated LED loads 30 minutes after startup.
